Immunization is widely regarded as one of the most effective and beneficial tools for protecting the public's health. In the United States, immunization programs have resulted in the eradication of smallpox, the elimination of polio, and the control and near elimination of once-common, often debilitating and potentially life-threatening diseases, including measles, mumps, rubella, diphtheria, pertussis, tetanus, and Haemophilus influenza type b. Along with the benefits of widespread immunization, however, have come concerns about the safety of vaccines. No vaccine is perfectly safe or effective, and vaccines may lead to serious adverse effects in some instances. Furthermore, if a serious illness is observed after vaccination, it is often unclear whether that sequence is coincidental or causal, and it can be difficult to determine the true nature of the relationship, if any, between the vaccination and the illness. Ironically, the successes of vaccine coverage in the United States have made it more difficult for the public to weigh the benefits and complications of vaccines because the now-controlled diseases and their often-serious risks are no longer familiar. However, because vaccines are so widely used-and because state laws require that children be vaccinated before entering daycare and school, in part to protect others-it is essential that safety concerns be fully and carefully studied. Immunization Safety Review: Measles-Mumps-Rubella Vaccine and Autism, the first of a series from the Institute of Medicine (IOM) Immunization Safety Review Committee, presents an assessment of the evidence regarding a hypothesized causal association between the measles-mumps-rubella (MMR) vaccine and autism, an assessment of the broader significance for society of the issues surrounding the MMR-autism hypothesis, and the committee's conclusions and recommendations based on those assessments.

In light of the discovery of Autoimmune Syndrome Induced by Adjuvants, or ASIA, Vaccines and Autoimmunity explores the role of adjuvants – specifically aluminum in different vaccines – and how they can induce diverse autoimmune clinical manifestations in genetically prone individuals. Vaccines and Autoimmunity is divided into three sections; the first contextualizes the role of adjuvants in the framework of autoimmunity, covering the mechanism of action of adjuvants, experimental models of adjuvant induced autoimmune diseases, infections as adjuvants, the Gulf War Syndrome, sick-building syndrome (SBS), safe vaccines, toll-like receptors, TLRs in vaccines, pesticides as adjuvants, oil as adjuvant, mercury, aluminum and autoimmunity. The following section reviews literature on vaccines that have induced autoimmune conditions such as MMR and HBV, among others. The final section covers diseases in which vaccines were known to be the solicitor – for instance, systemic lupus erythematosus – and whether it can be induced by vaccines for MMR, HBV, HCV, and others. Edited by leaders in the field, Vaccines and Autoimmunity is an invaluable resource for advanced students and researchers working in pathogenic and epidemiological studies.

shocking tale, chronicling the global efforts to sell and compel this alleged miracle. The book opens with the vaccine 's invention, winds through its regulatory labyrinths, details the crushing denial and dismissal of reported harms and deaths, and uncovers the enormous profits pharma and inventors have reaped. Authors Holland, Mack Rosenberg, and Iorio drill down into the clinical trial data, government approvals, advertising, and personal accounts of egregious injuries that have followed in countries as far-flung as Japan, Australia, Colombia, India, Ireland, the U.K. and Denmark. The authors have written an unprecedented expos é about this vaunted vaccine. Written in plain language, the book is for everyone concerned – parents, patients, doctors, nurses, scientists, healthcare organizations, government officials, and schools. Ultimately, this book is not just about the HPV vaccine, but about how industry, government, and medical authorities may be putting the world 's children in harm 's way.

How Not to Die

Sustainable Medicine is based on the premise that twenty-first century Western medicine—driven by vested interests—is failing to address the root causes of disease. Symptom-suppressing medication and “ polypharmacy ” have resulted in an escalation of disease and a system of so-called “ health care, ” which more closely resembles “ disease care. ” In this essential book, Dr. Sarah Myhill aims to empower people to heal themselves by addressing the underlying causes of their illness. She presents a logical progression from identifying symptoms, to understanding the underlying mechanisms, to relevant interventions and tests and tools with which to tackle the root causes. As Myhill writes, “ It 's all about asking the question ‘ why? ’ ” Sustainable Medicine covers a wide range of symptoms including

inflammation (infection, allergy, autoimmunity), fatigue, pain, toxic symptoms, deficiency symptoms, and hormonal symptoms. And Dr. Myhill includes a toolbox of treatments for specific illnesses and ailments, as well as a general approach to avoiding and treating all disease. Finally, she offers a series of case histories to show how people have successfully taken control of their health and healed even in the face of the most discouraging symptoms—all without the harmful interventions of 21st century Western medicine.

The Beautiful Cure

Thomas Cowan was a 20-year-old Duke grad--bright, skeptical, and already disillusioned with industrial capitalism--when he joined the Peace Corps in the mid-1970s for a two-year tour in Swaziland. There, he encountered the work of Rudolf Steiner and Weston A. Price--two men whose ideas would fascinate and challenge him for decades to come. Both drawn to the art of healing and repelled by the way medicine was--and continues to be--practiced in the United States, Cowan returned from Swaziland, went to medical school, and established a practice in New Hampshire and, later, San Francisco. For years, as he raised his three children, suffered the setback of divorce, and struggled with a heart condition, he remained intrigued by the work of Price and Steiner and, in particular, with Steiner's provocative claim that the heart is not a pump. Determined to practice medicine in a way that promoted healing rather than compounded ailments, Cowan dedicated himself to understanding whether Steiner's claim could possibly be true. And if Steiner was correct, what, then, is the heart? What is its true role in the human body? In this deeply personal, rigorous, and riveting account, Dr. Cowan offers up a daring claim: Not only was Steiner correct that the heart is not a pump, but our understanding of heart disease--with its origins in the blood vessels--is completely wrong. And this gross misunderstanding, with

its attendant medications and risky surgeries, is the reason heart disease remains the most common cause of death worldwide. In *Human Heart, Cosmic Heart*, Dr. Thomas Cowan presents a new way of understanding the body's most central organ. He offers a new look at what it means to be human and how we can best care for ourselves--and one another.

The Vaccine Book

"When President Nixon launched the War on Cancer with the signing of the National Cancer Act of 1971 and the allocation of billions of research dollars, it was amidst a flurry of promises that a cure was within reach. The research establishment was trumpeting the discovery of oncogenes, the genes that supposedly cause cancer. As soon as we identified them and treated cancer patients accordingly, cancer would become a thing of the past. Fifty years later it's clear that the War on Cancer has failed--despite what the cancer industry wants us to believe. New diagnoses have continued to climb; one in three people in the United States can now expect to battle cancer during their lifetime. For the majority of common cancers, the search for oncogenes has not changed the treatment: We're still treating with the same old triad of removing (surgery), burning out (radiation), or poisoning (chemotherapy). In *Cancer and the New Biology of Water*, Thomas Cowan, MD, argues that this failure was inevitable because the oncogene theory is incorrect--or at least incomplete--and based on a flawed concept of biology in which DNA controls our cellular function and therefore our health. Instead, Dr. Cowan tells us, the somatic mutations seen in cancer cells are the result of a cellular deterioration that has little to do with oncogenes, DNA, or even the nucleus. The root cause is metabolic dysfunction that deteriorates the structured water that forms the basis of cytoplasmic health. Despite mainstream medicine's failure to

bring an end to suffering or deliver on its promises, it remains illegal for physicians to prescribe anything other than the "standard of care" for their cancer patients, despite the fact that gentler, more effective, and more promising treatments exist"--

Childhood immunization is one of the major public health measures of the 20th century and is now receiving special attention from the Clinton administration. At the same time, some parents and health professionals are questioning the safety of vaccines because of the occurrence of rare adverse events after immunization. This volume provides the most thorough literature review available about links between common childhood vaccines--tetanus, diphtheria, measles, mumps, polio, Haemophilus influenzae b, and hepatitis B--and specific types of disorders or death. The authors discuss approaches to evidence and causality and examine the consequences--neurologic and immunologic disorders and death--linked with immunization. Discussion also includes background information on the development of the vaccines and details about the case reports, clinical trials, and other evidence associating each vaccine with specific disorders. This comprehensive volume will be an important resource to anyone concerned about the immunization controversy: public health officials, pediatricians, attorneys, researchers, and parents.

due to infectious diseases. Today, vaccines exist for many viral and bacterial diseases. The National Childhood Vaccine Injury Act, passed in 1986, was intended to bolster vaccine research and development through the federal coordination of vaccine initiatives and to provide relief to vaccine manufacturers facing financial burdens. The legislation also intended to address concerns about the safety of vaccines by instituting a compensation program, setting up a passive surveillance system for vaccine adverse events, and by providing information to consumers. A key component of the legislation required the U.S. Department of Health and Human Services to collaborate with the Institute of Medicine to assess concerns about the safety of vaccines and potential adverse events, especially in children. Adverse Effects of Vaccines reviews the epidemiological, clinical, and biological evidence regarding adverse health events associated with specific vaccines covered by the National Vaccine Injury Compensation Program (VICP), including the varicella zoster vaccine, influenza vaccines, the hepatitis B vaccine, and the human papillomavirus vaccine, among others. For each possible adverse event, the report reviews peer-reviewed primary studies, summarizes their findings, and evaluates the epidemiological, clinical, and biological evidence. It finds that while no vaccine is 100 percent safe, very few adverse events are shown to be caused by vaccines. In addition, the evidence shows that vaccines do not cause several conditions. For example, the MMR vaccine is not associated with autism or childhood diabetes. Also, the DTaP vaccine is not associated with diabetes and the influenza vaccine given as a shot does not exacerbate asthma. Adverse Effects of Vaccines will be of special interest to the National Vaccine Program Office, the VICP, the Centers for Disease Control and Prevention, vaccine safety researchers and manufacturers, parents, caregivers, and health professionals in the private and public sectors.

Immunization Safety Review

The Immunization Safety Review Committee was established by the Institute of Medicine (IOM) to evaluate the evidence on possible causal associations between immunizations and certain adverse outcomes, and to then present conclusions and recommendations. The committee's mandate also includes assessing the broader societal significance of these immunization safety issues. While all the committee members share the view that immunization is generally beneficial, none of them has a vested interest in the specific immunization safety issues that come before the group. The committee reviews three immunization safety review topics each year, addressing each one at a time. In this fifth report in a series, the committee examines the hypothesis that exposure to polio vaccine contaminated with simian virus 40 (SV40), a virus that causes inapparent infection in some monkeys, can cause certain types of cancer.

This completely revised and enlarged 2nd edition of *The Tobacco Epidemic* provides a comprehensive update of the clinical, public health and political aspects of tobacco smoking. Since its 1st edition in 1997, knowledge on the health hazards of tobacco and nicotine addiction has increased considerably, but recent data has shown that the global problem has become more aggravated in low- and middle-income countries: if current trends continue, tobacco smoking will be responsible for the deaths of 1 billion people in the 21st century. Written by outstanding international experts, the book covers the

history of tobacco production and use, the economics of tobacco use and control, as well as the health consequences of active and passive smoking in both adults and children. Special chapters discuss the impact of media, movies and TV on tobacco consumption in young people, the patterns and predictors of smoking cessation in the general population and in different social subgroups, and initiatives supported by the WHO Framework Convention on Tobacco Control. Readers will find the latest information on how nicotine dependence is treated with nicotine replacement products, what role health care professionals play in helping smokers to quit and what effects smoke-free environments, advertising bans and price increases have on smoking prevalence. The potential harms and benefits of smokeless tobacco, waterpipe tobacco smoking and electronic cigarettes are also evaluated. This book is a must-read for anyone in the medical profession who treats patients with smoking-related diseases and for those engaged in tobacco control. It will also be appreciated by interested nonmedical readers like journalists and legislators.

The vast majority of premature deaths can be prevented through simple changes in diet and lifestyle. In *How Not to Die*, Dr. Michael Greger, the internationally-renowned nutrition expert, physician, and founder of NutritionFacts.org, examines the fifteen top causes of premature death in America—heart disease, various cancers, diabetes, Parkinson's, high blood pressure, and more—and explains how nutritional and lifestyle interventions can sometimes trump prescription pills

and other pharmaceutical and surgical approaches, freeing us to live healthier lives. The simple truth is that most doctors are good at treating acute illnesses but bad at preventing chronic disease. The fifteen leading causes of death claim the lives of 1.6 million Americans annually. This doesn't have to be the case. By following Dr. Greger's advice, all of it backed up by strong scientific evidence, you will learn which foods to eat and which lifestyle changes to make to live longer. History of prostate cancer in your family? Put down that glass of milk and add flaxseed to your diet whenever you can. Have high blood pressure? Hibiscus tea can work better than a leading hypertensive drug-and without the side effects. Fighting off liver disease? Drinking coffee can reduce liver inflammation. Battling breast cancer? Consuming soy is associated with prolonged survival. Worried about heart disease (the number 1 killer in the United States)? Switch to a whole-food, plant-based diet, which has been repeatedly shown not just to prevent the disease but often stop it in its tracks. In addition to showing what to eat to help treat the top fifteen causes of death, How Not to Die includes Dr. Greger's Daily Dozen -a checklist of the twelve foods we should consume every day. Full of practical, actionable advice and surprising, cutting edge nutritional science, these doctor's orders are just what we need to live longer, healthier lives.

Cancer and the New Biology of Water

Drawing on fifty years of experience caring for children and adults, Dr. Moskowitz examines vaccines and our current policy regarding them. Weaving together a tapestry of observed facts, clinical and basic science research, news reports from the media, and actual cases from his own practice, he offers a systematic review of the subject as a whole. He provides scientific evidence for his clinical impression that the vaccination process, by its very nature, imposes substantial risks of disease, injury, and death that have been persistently denied and covered up by manufacturers, the CDC, and the coterie of doctors who speak for it. With the aim of acknowledging these risks, taking them seriously, understanding them more holistically, and ultimately assessing them on a deeper level, he proposes a nationwide debate based on objective scientific research, including what we already know and what still needs to be investigated in the future. He argues that with no serious public health emergency to justify them, requiring vaccines of everyone deprives us all of genuinely informed consent, and prevents parents from making health-care decisions for our children, basic human rights that we still profess to hold dear. For the present, given the legitimate controversy surrounding the mandates, he proposes that most vaccines simply be made optional and that further research into their risks and benefits be conducted by an independent agency in the public interest, untainted by industry funding, CDC sponsorship, and the quasi-religious sanctimony that is widely invoked on their behalf.

An Introduction to Childhood

Over the past 50 years, rates of chronic illness, learning disabilities, and allergies in children have exploded--1 in 6 children has a diagnosed learning disorder, 1 in 50 has autism, and 1 in 13 has severe food allergies. Instead of blaming genetics or increased awareness and diagnosis, author Thomas Cowan, MD, attributes these rising numbers to our current vaccination policy. In *Vaccines, Auto-Immunity, and the Assault on Childhood*, Cowan combines his years of experience as a medical practitioner with his research into the history and science of vaccines to show how childhood illnesses, which help children to develop a robust immune system, are now eschewed by conventional medicine in favor of an increasing array of vaccinations that do more harm than good. Invoking philosopher Rudolph Steiner's vision of vaccines as inspired by "spirits of darkness," Cowan brings to light the various ways in which scientists and government officials work to promote a vaccine program that only increases suffering. Along the way he questions commonly held views of cell biology, the role of water in the body, and the spatial and spiritual components of autism. Additionally, he provides hope of recovery in the form of a nontoxic course of treatment for those suffering chronic inflammation and other averse immune responses to vaccines. Cowan's thoughtfully bold writing takes us on a journey into the history of illness, questioning the true origins of diseases such as polio, and asking important questions, such as: why did paralytic polio make a sudden appearance in the US in the years between 1916-1918? The answers lie far beyond what conventional medicine would have us believe. *Vaccines, Auto-Immunity, and the Assault on Childhood*

“Visceral.” —Wall Street Journal “Illuminating.” —Publishers Weekly “Heroic.” —Science The immune system holds the key to human health. In *The Beautiful Cure*, leading immunologist Daniel M. Davis describes how the scientific quest to understand how the immune system works—and how it is affected by stress, sleep, age, and our state of mind—is now unlocking a revolutionary new approach to medicine and well-being. The body’s ability to fight disease and heal itself is one of the great mysteries and marvels of nature. But in recent years, painstaking research has resulted in major advances in our grasp of this breathtakingly beautiful inner world: a vast and intricate network of specialist cells, regulatory proteins, and dedicated genes that are continually protecting our bodies. Far more powerful than any medicine ever invented, the immune system plays a crucial role in our daily lives. We have found ways to harness these natural defenses to create breakthrough drugs and so-called immunotherapies that help us fight cancer, diabetes, arthritis, and many age-related diseases, and we are starting to understand whether activities such as mindfulness might play a role in enhancing our physical resilience. Written by a researcher at the forefront of this adventure, *The Beautiful Cure* tells a dramatic story of scientific detective work and discovery, of puzzles solved and mysteries that linger, of lives sacrificed and saved. With expertise and eloquence, Davis introduces us to this revelatory new understanding of the human body and what it takes to be healthy.

'My first serious blackout marked the line between sanity and insanity. Though I would have moments of lucidity over the coming days and weeks, I would never again be the same person ' Susannah Cahalan was a happy, clever, healthy twenty-four-year old. Then one day she woke up in hospital, with no memory of what had happened or how she had got there. Within weeks, she would be transformed into someone unrecognizable, descending into a state of acute psychosis, undergoing rages and convulsions, hallucinating that her father had murdered his wife; that she could control time with her mind. Everything she had taken for granted about her life, and who she was, was wiped out. Brain on Fire is Susannah's story of her terrifying descent into madness and the desperate hunt for a diagnosis, as, after dozens of tests and scans, baffled doctors concluded she should be confined in a psychiatric ward. It is also the story of how one brilliant man, Syria-born Dr Najjar, finally proved - using a simple pen and paper - that Susannah's psychotic behaviour was caused by a rare autoimmune disease attacking her brain. His diagnosis of this little-known condition, thought to have been the real cause of devil-possessions through history, saved her life, and possibly the lives of many others. Cahalan takes readers inside this newly-discovered disease through the progress of her own harrowing journey, piecing it together using memories, journals, hospital videos and records. Written with passionate honesty and intelligence, Brain on Fire is a searingly personal yet universal book, which asks what happens when your identity is suddenly destroyed, and how you get it back. 'With eagle-eye precision and brutal honesty, Susannah Cahalan turns her journalistic gaze on herself as she bravely looks back on one of the most harrowing and unimaginable experiences one could ever face: the loss of mind, body and self. Mitochondria are the powerhouses of our cells, essential for the production and management of energy at the cell level. Dr. Sarah Myhill has spent years studying the relationship between mitochondrial malfunction and one of the most common problems that leads people to the doctor's office: fatigue. In *Diagnosis and Treatment of Chronic Fatigue Syndrome and Myalgic Encephalitis*, Dr. Myhill examines this essential role of our mitochondria in energy production and why it is key to understanding and overcoming Chronic Fatigue Syndrome (CFS) and the inflammation that often accompanies it: Myalgic Encephalitis (ME). She explains the importance of healthy mitochondria, how we can assess how well they are functioning, what we can do to keep them healthy, and how to restore them to health if problems arise. Since publication of the first edition in 2014, new research and new clinical findings have shed further light on a condition that is debilitating to those who suffer from it, but "all in the head" to many doctors. The second edition of this groundbreaking book includes new insights and chapters on why CFS/ME is the most poorly treated condition in Western medicine, the role of the gut, allergy and autoimmunity, Lyme disease and other coinfections, reprogramming the immune system, reprogramming the brain, and the roadmap to recovery.

From San Francisco to Shanghai, from Vancouver to Venice, controversy over vaccines is erupting around the globe. Fear is spreading. Banished diseases have returned. And a militant "anti-vax" movement has surfaced to campaign against children's shots. But why? In *The Doctor Who Fooled the World*, award-winning investigative reporter Brian Deer exposes the truth behind the crisis. Writing with the page-turning tension of a detective story, he unmaskes the players and unearths the facts. Where it began. Who was responsible. How they pulled it off. Who paid. At the heart of this dark narrative is the rise of the so-called "father of the anti-vaccine movement": a British-born doctor, Andrew Wakefield. Banned from medicine, thanks to Deer's discoveries, he fled to the United States to pursue his ambitions, and now claims to be winning a "war." In an epic investigation spread across fifteen years, Deer battles medical secrecy and insider cover-ups, smear campaigns and gagging lawsuits, to uncover rigged research and moneymaking schemes, the heartbreaking plight of families struggling with disability, and the scientific scandal of our time.

The Tobacco Epidemic

The Mosaic of Autoimmunity: The Novel Factors of Autoimmune Diseases describes the multifactorial origin and diversity of expression of autoimmune diseases in humans. The term implies that different combinations of factors in autoimmunity produce varying and unique clinical pictures in a wide spectrum of autoimmune diseases. Most of the factors involved in autoimmunity can be categorized into four groups: genetic, immune defects, hormonal and environmental factors. In this book, the environmental factors are reviewed, including infectious agents, vaccines as triggers of autoimmunity, smoking and its relationship with rheumatoid arthritis, systemic lupus erythematosus, thyroid disease, multiple sclerosis and inflammatory bowel diseases. An entirely new syndrome, the autoimmune/inflammatory syndrome induced by adjuvants (ASIA), is also included, along with other diseases that are now recognized as having an autoimmune etiopathogenesis. Highlights the concept of the mosaic of autoimmune manifestations Includes new visions on unsuspected molecules Provides updated knowledge to physicians helping patients with autoimmune diseases Presents thorough, up-to-date information on specific diseases, along with clinical applications

The Childhood Immunization Schedule and Safety

Since the First Edition of The Autoimmune Diseases was published in 1985, interest as well as knowledge about autoimmune diseases has greatly increased. This edition incorporates new material and combines the basic aspects of autoimmunity with discussion of specific autoimmune diseases in humans.

It discusses the biological basis of disease at genetic, molecular, cellular, and epidemiologic levels. In addition to a comprehensive discussion of various autoimmune diseases and organ systems, the editors also cover the role of autoimmunity in cancer, AIDS, and aging. Key Features * Provides comprehensive discussions of all autoimmune diseases and organ systems * Offers "bench to bedside" coverage of autoimmunity for both clinicians and research scientists * Discusses the biological basis of disease at genetic, molecular, cellular, and epidemiologic levels * Examines the environmental determinants of autoimmune disease * Examines the association between autoimmunity and aging, cancer, and AIDS

Immunization Safety Review

Infection with the influenza virus can have a serious effect on the health of people of all ages, although it is particularly worrisome for infants, the elderly, and people with underlying heart or lung problems. A vaccine exists (the "flu shot") that can greatly decrease the impact of influenza. Because the strains of virus that are expected to cause serious illness and death are slightly different every year, the vaccine is also slightly different every year and it must be given every year, unlike other vaccines. The Immunization Safety Review committee reviewed the data on influenza vaccine and neurological conditions and concluded that the evidence favored rejection of a causal relationship between influenza vaccines and exacerbation of multiple sclerosis. For the other neurological conditions studied, the committee concluded the evidence about the effects of influenza vaccine is inadequate to accept or reject a causal relationship. The committee also reviewed theories on how the influenza vaccine could damage the nervous system. The evidence was at most weak that the vaccine could act in humans in ways that could lead to these neurological problems.

The Doctor Who Fooled the World

Immunization to protect infants and children from vaccine-preventable diseases is one of the greatest achievements of public health. Immunization is not without risks, however. It is well established, for example, that the oral polio vaccine can on rare occasion cause paralytic polio. The Immunization Safety Review Committee was established by the Institute of Medicine (IOM) to evaluate the available evidence on a series of immunization safety concerns. The committee is charged with examining three immunization safety hypotheses each year during the three-year study period (2001- 2003). While all of the committee members share the view that immunization is generally beneficial, none of them has a vested interest in the specific immunization safety issues that come before the group. In this report, which is the fourth in the series, the committee examines the hypothesis that the hepatitis B vaccine increases the risk for demyelinating disorders of the central or peripheral nervous systems, including multiple sclerosis (MS) and Guillain-Barr é syndrome (GBS).

death. Because of the success of vaccines, most Americans today have no firsthand experience with such devastating illnesses as polio or diphtheria. Health care providers who vaccinate young children follow a schedule prepared by the U.S. Advisory Committee on Immunization Practices. Under the current schedule, children younger than six may receive as many as 24 immunizations by their second birthday. New vaccines undergo rigorous testing prior to receiving FDA approval; however, like all medicines and medical interventions, vaccines carry some risk. Driven largely by concerns about potential side effects, there has been a shift in some parents' attitudes toward the child immunization schedule. The Childhood Immunization Schedule and Safety identifies research approaches, methodologies, and study designs that could address questions about the safety of the current schedule. This report is the most comprehensive examination of the immunization schedule to date. The IOM authoring committee uncovered no evidence of major safety concerns associated with adherence to the childhood immunization schedule. Should signals arise that there may be need for investigation, however, the report offers a framework for conducting safety research using existing or new data collection systems.

Diagnosis and Treatment of Chronic Fatigue Syndrome and Myalgic Encephalitis

In *How to End the Autism Epidemic*, Generation Rescue 's co-founder J.B. Handley offers a compelling, science-based explanation of what 's causing the autism epidemic, the lies that enable its perpetuation, and the steps we must take as parents and as a society in order to end it. While many parents have heard the rhetoric that vaccines are safe and effective and that the science is settled about the relationship between vaccines and autism, few realize that in the 1960s, American children received three vaccines compared to the thirty-eight they receive today. Or that when parents are told that the

odds of an adverse reaction are “ one in a million, ” the odds are actually one in fifty. Or that in the 1980s, the rate of autism was one in ten thousand children. Today it ’ s one in thirty-six. Parents, educators, and social service professionals around the country are sounding an alarm that we are in the midst of a devastating public health crisis—one that corresponds in lockstep with an ever-growing vaccine schedule. Why do our public health officials refuse to investigate this properly—or even acknowledge it? In *How to End the Autism Epidemic*, Handley confronts and dismantles the most common lies about vaccines and autism. He then lays out, in detail, what the truth actually is: new published science links the aluminium adjuvant used in vaccines to immune activation events in the brains of infants, triggering autism; and there is a clear legal basis for the statement that vaccines cause autism, including previously undisclosed depositions of prominent autism scientists under oath. While Handley ’ s argument is unsparing, his position is ultimately moderate and constructive: we must continue to investigate the safety of vaccines, we must adopt a position of informed consent, and every individual vaccine must be considered on its own merits. This issue is far from settled. By refusing to engage with parents and other stakeholders in a meaningful way, our public health officials destroy the public trust and enable the suffering of countless children and families.

By setting the complex story of American vaccination within the country's broader history, the author goes beyond the simple story of the triumph of science over disease and provides a new and perceptive account of the role of politics and social forces in medicine.
